FormFox Release 2026.6

STRY0135944 - Add NRCME Validation fields to UpdateOrderResult

For DOT Physical Digital Workflows configured to report to NRCME, the UpdateOrderResult will include the validation response received from FMCSA. This feature is controlled by a configuration flag and will be turned off by default. When enabled, the UpdateOrderResult will be held until FormFox receives the NRCME response and will then be sent to the sending facility with the NRCME validation information.

- **What is changing:** Two new fields, NRCMEValidationCode and NRCMEValidationStatus, are being added to the UpdateOrderResult. When the feature is enabled, the UpdateOrderResult will be sent after the NRCME response is received. If an error requires subsequent submissions to NRCME, an updated UpdateOrderResult will be sent each time a new validation response is received from FMCSA. **The feature will be off by default and must be enabled for the sending facility.**
- **Who this applies to:** API users receiving DOT Physical results who have the feature enabled

DFCT0015534 - MP Order Validation - Not working

A defect was identified with the Marketplace order validation introduced in STRY0130411. Marketplace orders containing known validation errors could be returned as Accepted without an MPONumber instead of returning the applicable validation error.

- **What is changing:** Marketplace order validation has been corrected so that orders containing known Marketplace validation errors are not returned as Accepted without an MPONumber. The applicable validation error will be returned in the CreateOrder response.
- **Who this applies to:** API users placing Marketplace orders
